**Exploring the existence of prebiotic species:
ALMA observations of amine-containing
organic molecule in star-forming regions.**

Abstract

A variety of complex organic molecules have been observed for decades in the interstellar medium. Some of them are considered to be delivered to the primordial Earth by comets, and contributed to the chemical evolution leading to terrestrial life. One example of such prebiotic species is amino acid. Glycine, the simplest amino acid, has been detected in comet 67P/C-G but its presence in molecular clouds is still uncertain.

In this work we analyze the ALMA archival data toward a few star-forming regions such as Orion KleinmannLow nebula and IRAS 16293-2422 to search molecules with amine functional group, which are suggested as precursors to glycine. We compare the results considering their different chemical condition.

Chapter 1

Introduction

1.1 Origin of life

The interstellar medium (ISM), where more than 190 molecules ranging from simple linear molecules to complex organic molecules (hereafter COMs) were detected, show chemically rich environment. Astronomers usually regard the species with more than six atoms as COMs. Not only O-bearing species, CH₃OH, CH₃OCH₃, HCOOCH₃, but also N-bearing species such as CH₃CH₂CN and CH₂CHCN are known COMs. In 2016, a chiral molecule propylene oxide (CH₃CHHCH₂O) was detected towards Sgr B2 (N) molecular cloud in absorption (McGuire et al. 2016). This detection implies that molecules can get sufficient complexity, and it will accelerate surveys of other chiral molecules, like amino acids. From this point of view, many observations were conducted to search for prebiotic molecules in the ISM, which might turn into the Seeds of Life when delivered to a planetary surface. Especially, a great attention was paid to amino acids, essential building blocks of terrestrial life; many surveys were made unsuccessfully to search for the simplest amino acid, glycine (NH₂CH₂COOH), towards Sgr B2 and other high-mass star forming regions (e.g., Brown et al. 1979; Snyder et al. 1983; Combes et al. 1996). In 2003, Kuan et al. (2003) claimed the first detection of glycine, however, several follow-up observations concluded denied

the detection (e.g., Jones et al. 2007). The difficulty of the past glycine surveys would be originated from potential weakness of glycine lines and low sensitivities of telescopes used for the surveys.
